Chapter 2 New “Opening” of Japan and Innovation

Section 1 Globalization of the Japanese Economy: Review

- Growth in Japanese exports was relatively slow in nominal terms in the 2000s.

Figure 2-1-7 Changes in exports to major countries
In real terms, exports from Japan grew faster than exports from the US and the EU.

Figure 2-1-10 Correlation between economic size and trade openness (1) 2009
The larger a country's economic size is, the smaller its trade openness tends to be.

Figure 2-1-11 Variable factors for the volume of bilateral trade
The conclusion of FTAs has a positive impact on the trade volume.

- Japan’s trade openness is low considering its economic size.
- The conclusion of FTAs tends to increase the trade volume.

(Note) China includes Hong Kong.

(Note) Real GDP is on a dollar basis. Japan's trade openness in 2009 was 24.8% (3.2 in logarithm).

(Note) The above numbers represent the rates of change (%) in real exports with the assumption of the presence or absence of each factor or a 1% change in each factor. The estimate period is from 1990 to 2009.
- Although the balance of inward foreign direct investment (FDI) has increased, it is still small by international standards.

Figure 2-1-13 Changes in outward and inward FDI and the overseas production ratio

1) Ratio of Japanese FDI to GDP

Outward FDI is on an upward trend.

(As a proportion of GDP, %)

![Graph showing balance of outward and inward FDI over years](image)

- The ratio of foreign workers in Japan is small and growth in their number is also low.
- The number of foreign students accepted into Japan is not necessarily small considering language problems.

Figure 2-1-16 Utilization of foreign workers

1) International comparison of the ratios of foreign workers

The ratio of foreign workers in Japan is small.

![Bar chart showing foreign workers ratio compared to other countries](image)

Figure 2-1-14 Correlation between economic size and trade openness

2) Inward FDI

The balance of inward FDI in Japan is small considering the country's economic size.

Log (Balance of inward FDI/Nominal GDP) (percentages expressed as logarithm)

![Scatter plot showing correlation between economic size and inward FDI](image)

(Note) The above is based on data for 2009 compiled by individual OECD countries.

Figure 2-1-17 Acceptance of foreign students

2) Foreign students in doctoral courses and per-capita GDP

The number of foreign students accepted into Japan is not necessarily small.

![Graph showing foreign students acceptance compared to GDP](image)

(Note) The data for per-capita GDP are on a purchasing power parity basis.
Section 2 Impact of Globalization on the Domestic Economy

- While the globalization of corporate activities lowers labor’s share of income, it raises the wage level by capturing foreign demand and increasing value added through improved governance.

Figure 2-2-3 Globalization of corporate activities and personnel costs

(1) Labor's share of income
(2) Wages

Although the globalization of corporate activities lowers labor's share of income, it has a positive impact on wages.

(2) Rate of return on FDI and FDI ratio

The higher a country's FDI ratio is, the higher its rate of return on FDI tends to be.

Figure 2-2-5 International comparative analysis of the rate of return on FDI

(Rate of return on outward FDI, %)

(Note) The above numbers show changes in labor's share of income and per-capita personnel cost on the assumption of a 1 percentage change in each in each variable.

- If the ratio of FDI rises, the average rate of return on FDI will improve.
- The ratio of dividends Japan receives from FDI is not low by international standards.

Figure 2-2-6 Dividends received from FDI

(2) Ratio of dividends to returns on FDI
The ratio of dividends Japan receives from returns on FDI is not low compared with the ratios for other major countries.

(Note) The above numbers are the averages for 2006 to 2008.
- Expansion of trade and investment has a positive impact on productivity as their fundamental merit.
- However, the perception varies from industry to industry and from company to company.

Figure 2-2-8 Impact of EPAs, etc on earnings
(1) By industry
Japanese companies generally have a positive stance on FTAs, etc.

Figure 2-2-10 Foreign companies’ returns on FDI
(2) Rate of returns on inward FDI in OECD countries
The rate of returns on inward FDI in Japan is high.

Figure 2-2-12 Barriers to inward FDI
(2) Stance toward friendly M&As
Aversion to foreign companies is persistent.

(Note) The above numbers represent changes in the TFP growth rate on the assumption of a 10 percentage point change in each variable.

(Note) The rate of returns on inward FDI in Luxemburg is 75%.
Section 3 Response to Global Shift to Knowledge-Based Economy

- Japanese companies’ investments in intangible assets are mainly investments in innovative property including R&D investment. Investment in “economic competencies” including brands and organizational reform is relatively small.

Figure 2-3-12 Changes in investments in and stocks of intangible assets
(1) Classification of intangible assets
Intangible assets are classified into three types: computerized information, innovative property and economic competencies.

<table>
<thead>
<tr>
<th>Computerized information</th>
<th>Innovative property</th>
<th>Economic competencies</th>
</tr>
</thead>
<tbody>
<tr>
<td>Custom-made software</td>
<td>Natural sciences-related R&amp;D</td>
<td>Brands</td>
</tr>
<tr>
<td>Package software</td>
<td>Resource development rights</td>
<td>Corporate human capital</td>
</tr>
<tr>
<td>Self-developed software</td>
<td>Copyrights and licenses</td>
<td>Organizational structures</td>
</tr>
<tr>
<td>Database</td>
<td>Other product development, design, non-natural sciences R&amp;D</td>
<td></td>
</tr>
<tr>
<td>(Design, display, machinery design, construction design, financial product development)</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Figure 2-3-14 International comparison of investments in intangible assets
(1) Mix of investments in intangible assets
The ratio of innovative property is high in Japan.

(Note) The above data are for 2005. However, the data concerning the US are for 2006.

- Since 2000, growth in the ratio of intangible assets to GDP has slowed down on both flow and stock bases (in real terms).

Figure 2-3-12 Changes in investments in and stocks of intangible assets
(3) Ratio of investments in intangible assets to GDP (real)
(4) Ratio of stocks of intangible assets to GDP (real)
Investments in intangible assets by Japanese companies account for slightly more than 10% of GDP.

(Note) The above data are based on estimates by the Cabinet Office. Both intangible assets and GDP are in real terms. Data on intangible assets concern assets held by private companies. Average growth in intangible assets: 4.8% in 1990-1995, 3.7% in 1996-2001 and 2.6% in 2002-2007.
In Japan there are a large amount of stocks of intangible assets, mainly held by industries with large R&D expenses.

Globalized companies’ investments in intangible assets have significant effects.

Figure 2-3-15 Intangible assets by industry
(2) Stocks
The processing and other manufacturing industries hold a relatively large amount of intangible assets.
(Ratio to overall assets, %)

Figure 2-3-17 Market's assessment of investments in intangible assets
Globalized companies' investments in intangible assets have significant effects.
(Improvement in the market's assessment of companies, percentage points)

Figure 2-3-9 Inter-company technology partnership and internationally co-authored scientific papers
(2) Ratio of internationally co-authored scientific papers
In Japan, the ratio of internationally co-authored scientific papers is low.

(Note) 1. The above data are for 2008.
2. R&D efficiency = Value added (five-year backward average)/R&D expenses five years before (five-year backward average)
3. The "ratio of international patents" refers to the ratio of patents on inventions made abroad which are filed by domestic residents in accordance with the PCT (Patent Cooperation Treaty).

As Japanese companies’ R&D efficiency is low, it is essential to improve the efficiency through international partnership.

(Note) The above data are for 2009.
